-It is not allowed to use the unit if the covers have been removed.

-We decline all responsibility for damages and injuries caused by an improper use of the module. It is highly recommended to read the operators manual before any kind of operation.

Note

The information in this manual is subject to change without notice. We take no responsibility whatsoever for any error in the document. We reserve the right to make changes in the product design without reservation and without notification to the users.

Filename EHQ10x_02_eng.____; Version 3.14 from 2013-09-04

1. General information

The EHQ's are one channel high voltage supplies in a 3U Eurocard Chassis, 8TE wide. The units offers manual control via the front panel and operation via USB and RS232 interface (optional: CAN Bus interface). The interface control supports more functionality then the manual control.

The high voltage supplies features high precision output voltage and very low ripple, even under full load. Separate hardware switches allow to put voltage and current limits in 10%-steps. The INHIBIT input protects sensitive devices. Additionally, a maximum output current can be specified via the interface. The high voltage source is protected against overload and short circuit. The output polarity can be switched over. The HV-GND is connected to the chassis and the powering GND.

2. Technical data

Type (with USB and RS 232)	EHQ 102M	EHQ 103M	EHQ 104M	EHQ 105M			
Output voltage V_O nom	0 ... 2 kV	0 ... 3 kV	0 ... 4 kV	0 ... 5 kV			
Output current I_O nom	6 mA	4 mA	3 mA	2 mA			
	Option N12	3 mA	2 mA	1 mA			
	Option 104	100 μ A	100 μ A	100 μ A			
Ripple and noise	< 2 mV _{P-P}			< 5 mV _{P-P}			
Resolution of current measurement	1 μ A; option 104: I_O nom = 100 μ A \Rightarrow 100 nA						
Resolution of voltage measurement	1 V						
Accuracy	current measurement	$\pm (0,05\% I_O + 0,02\% I_O$ nom + 1 digit) for one year					
	voltage measurement	$\pm (0,05\% V_O + 0,02\% V_O$ nom + 1 digit) for one year					
The measurement accuracy is guaranteed only in the range $1\% * V_O$ nom < $V_O \leq V_O$ nom !							
LCD display	4 digits with sign, switch controlled voltage display in [V] current display in [A], with option 104 in [mA]						
Stability	ΔV_O (no load / load)	$< 5 * 10^{-5}$					
	$\Delta V_O/V_{INPUT}$	$< 5 * 10^{-5}$					
Temperature coefficient	$< 5 * 10^{-5}/K$						
Voltage control	CONTROL switch in position -manual: 10-turn potentiometer, -DAC: control via serial interface						
Rate of change of output voltage	HV -ON/OFF	500 V/s (hardware ramp)					
	remote control	2 ... 255 V/s (software ramp)					
Protection	-separate current and voltage limit (hardware, rotary switch in 10%-steps) -INHIBIT (external signal, TTL level, Low=active) -programmable current limit (software)						
Power requirement V_{IN}	± 24 V (< 500 mA), option: ± 12 V (< 500 mA)						
Temperature ranges	operating: 0 ... 50 °C		storage: -20 ... +60 °C				
Packing	3U Euro cassette / 160 mm depth / 40,8 mm wide						
Connectors	96-pin connector according to DIN 41612 on the rear, USB mini B on the front panel						
HV connector	SHV-Connector at the front panel						
Inhibit connector	1-pin Lemo-hub						

3. EHQ Description

The functional principle is described in the block diagram, Appendix A.

High voltage supply

For the high voltage generation a patented highly efficient resonance converter circuit is used, which provides a sinusoidal voltage with low harmonics for the HV-transformer. For the high voltage rectification high speed HV-diodes are used. A high-voltage switch, connected to the rectifier allows the selection of the polarity. The consecutive active HV-filter damps the residual ripple and ensures low ripple and noise values as well as the stability of the output voltage. A precision voltage divider is integrated in the HV-filter to provide a feedback voltage for the output voltage control, an additional voltage divider supplies the signal for the maximum voltage monitoring. A precision control amplifier compares the feedback voltage with the set value given by the DAC (remote control) or the potentiometer (manual control). Signals for the control of the resonance converter and the stabilizer circuit are derived from the result of the comparison. The two-stage layout of the control circuit results in an output voltage, stabilized with very high precision to the set point.

Separate security circuits prevent exceeding the front-panel switch settings for the current I_{max} and voltage V_{max} limits. A monitoring circuit prevents malfunction caused by low supply voltage.

The internal error detection logic evaluates the corresponding error signals and the external INHIBIT signal and impacts the output voltage according to the setup. In addition this allows the detection of short over currents due to single flashovers.

Digital control unit

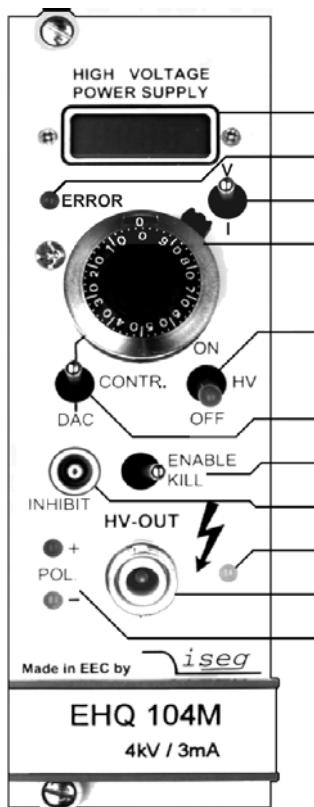

A micro controller handles all internal control, evaluation and calibration functions. The actual voltages and currents are read cyclically by an ADC with a connected multiplexer. The readings are processed and displayed on the 4 digit LCD. The current and voltage hardware limits are retrieved cyclically several times per second. A reference voltage source provides a precise voltage reference for the ADC and the control voltage for the manual operation mode of the unit.

In the computer controlled mode the set values for the corresponding channels are generated by a 16-Bit DAC.

Filter

A special feature of the unit is a tuned filtering concept, which prevents perturbation of the unit by external electromagnetic radiation, as well as the emittance of interferences by the module. A filtering network for the supply voltages is located next to their connectors, the converter circuits of the individual channels are protected by additional filters. The high-voltage filters are housed in individual metal enclosures to shield even minimal interference radiation.

4. Front panel

- [1] 4 digit LCD display
- [2] Error indicator
- [3] Measuring switch
- [4] 10-turn potentiometer
- [5] HV-ON switch
- [6] CONTROL switch
- [7] KILL switch
- [8] INHIBIT input
- [9] HV-ON indicator
- [10] HV output
- [11] Polarity indicator

5. Handling

The unit is set into operating state by connecting at the 96-pin connector according to DIN 41612 on the backside. This also attaches the RS232 interface. The USB interface is connected via the USB mini B connector on the frontpanel (below the polarity indicator).

Before the unit is powered the desired output polarity must be selected by the rotary switch on the cover side (see appendix B). The chosen polarity is displayed by a LED on the front panel [11] and a sign on the LCD [1].

Attention! It is not allowed to change the polarity under power!

An undefined switch setting (not at one of the end positions) will cause no output voltage.

High voltage output is switched on with HV-ON switch [5] at the front panel. The viability is signalled by the yellow LED [9].

Attention! If the CONTROL switch [6] is in upper position (manual control), high voltage is generated at the HV-output [10], started with a ramp speed from 500 V/s (hardware ramp) to the set voltage given by the 10-turn potentiometer [4].
This is also the case, if DAC control is switched over to manual control while operating.

If the CONTROL switch [6] is in lower position (DAC), high voltage will be activated only after receiving corresponding serial interface (DAC) commands.

Attention! If the function "Autostart" has been activated in the previous operating session, the high voltage generation starts immediately with the saved parameters!

The LCD [1] displays the output voltage in [V] or the output current in [μ A], depending on the position of the Measuring switch [3].

In the manual control mode the output voltage can be set via 10-turn potentiometer [4] in a range from 0 to the maximum voltage.

If the CONTROL switch [6] is switched over to serial interface control (DAC), the DAC takes over the last set output voltage of the manual control. The output voltage can be changed remotely with a programmable ramp speed (software ramp) from 2 to 255 V/s in a range from 0 to the maximum voltage.

The maximum output current for each channel (current trip) can be set via the remote interface in units of the resolution of the upper measurement range. If the output current exceeds the programmable limit, the output voltage will be shut off permanently by the software. A recovery of the voltage is possible after "Read status word" and then "Start voltage change" via serial interface. If "Auto start" is active, "Start voltage change" is not necessary.

The maximum output voltage and current can be selected in 10%-steps with the rotary switches V_{max} and I_{max} (switch dialled to 10 corresponds to 100%) on the cover side (see appendix B) independently of programmable current trip. The red error LED on the front panel [2] signals if the output voltage or current approaches the limits.

The KILL switch [7] specifies the response on exceeding limits or on the external protection signal at the INHIBIT input [8] as follows:

Switch to the right position: (ENABLE KILL) When exceeding V_{max} , I_{max} or in the presence of an INHIBIT signal (Low=active) the output voltage will be shut off permanently without ramp. The output voltage is only restored after switching HV-ON [5] or KILL [7] or "Read status word" and then "Start voltage change" by DAC control. If "Auto start" is active, "Start voltage change" is not necessary.

Note: If a capacitance is effective at the HV-output or when using a high voltage ramp speed (hardware ramp) under high loads, then the KILL function may be triggered by the capacitor charging currents. In this case smaller output voltage change rates (software ramp) should be used or ENABLE KILL should only be selected once the set voltage is reached at the output.

Switch to the left position: (DISABLE KILL) The output voltage is limited to V_{max} , the output current to I_{max} respectively; INHIBIT shuts the output voltage off without ramp, the previous voltage setting will be restored with hard- or software ramp once INHIBIT no longer being present.

6. RS232 interface resp. USB interface

The following functionality is provided for the operation of the high voltage units via the serial interface.

Serial interface control mode

- Write function: set voltage; ramp speed; maximal output current (current trip); auto start
- Switch function: output voltage = set voltage, output voltage = 0
- Read function: set voltage; actual output voltage; ramp speed; actual output current; current trip; auto start ; hardware limits current and voltage; status

Front panel switches have priority over software control.

Manual control mode

While the unit is operated in manual control mode, RS232 read cycles are interpreted only. Commands are accepted, but do not result in a change of the output voltage.

Pin assignment 96-pin connector on the flip side

A3 B3 C3	+24V
A5 B5 C5	GND, connected to chassis and HV-GND
A7 B7 C7	-24V
A9	@GND
B9	@RXD
C9	@TXD
	}
	} potential free

Specification of the RS232 interface

The data exchange is character based, the synchronisation for the transfer direction PC to HV-source (input) is performed using an echo. The data transfer to the PC (output) is asynchronous. Between two characters a programmable delay time is included to allow the computer to receive and evaluate the incoming data. The default delay time setting is 3 ms.

The hardware setting of the RS232 interface is 9600 bit/s, 8 bit/character, no parity, 1 stop bit.

Signal transmission is performed potential free via the @RxD and @TxT, relative to @GND. The pin assignment at the PC side is given in table 1. The bridging on the PC side if a three-lead cable is used, is also given in table 1.

Table 1:

Signal pin assignment

Signal RS 232	PC DSUB9	PC DSUB25	Connection 3-lead cable
RxD	2	3	
TxD	3	2	
GND	5	7	
	4	20	—
	6	6	—
	8	5	—

Syntax

The commands are transmitted in ASCII. All commands are terminated by the sequence <CR> <LF> (0x0D 0x0A , 13 10 respectively). Leading zeroes can be omitted on input, output is in fixed format.

Command set

Command	Computer	HV-supply
Read module identifier	# *	# * nnnnnn ; n.nn ; U ; I * (unit number ; softwarerel. ; V _{out} [V] ; I _{out} [μ A])
Read break time	W *	W * nnn * (break time 2 ... 255 ms)
Write break time	W=nnn *	W=nnn ** (break time = 2 - 255 ms)
Read actual voltage channel 1	U1 *	U1 * {polarity / voltage} * (in V)
Read actual current channel 1	I1 *	I1 * {mantisse / exp. with sign} * (in A)
Read voltage limit channel 1	M1 *	M1 * nnn * (in % of V _{out max})
Read current limit channel 1	N1 *	N1 * nnn * (in % of I _{out max})
Read set voltage channel 1	D1 *	D1 * {voltage} * (in V)
Write set voltage channel 1	D1=nnnn *	D1=nnnn ** (voltage in V; <M1)
Read ramp speed channel 1	V1 *	V1 * nnn * (2 ... 255 V/s)
Write ramp speed channel 1	V1=nnn *	V1=nnn ** (ramp speed = 2 - 255 V/s)
Start voltage change channel 1	G1 *	G1 * S1=xxx * (S1, \Rightarrow Status information)
Write current trip channel 1	L1=nnnn *	L1=nnnn ** (corresponding resolution current > 0)
Read current trip channel 1	L1 *	L1 * nnnn * (s.a., for nnnn=0 \Rightarrow no current trip)
Read status word channel 1	S1 *	S1 * xxx * (S1, \Rightarrow Status information)
Read module status channel 1	T1 *	T1 * nnn * (code 0...255, \Rightarrow Module status)
Write auto start channel 1	A1=nn *	A1=nn ** (conditions \Rightarrow Auto start)
Read auto start channel 1	A1 *	A1 * n * (8 \Rightarrow auto start is active; 0 \Rightarrow inactive)

* = <CR><LF>

Status information:

xxx:	ON<SP>	Output voltage according to set voltage
	OFF	Channel is switched off via the front panel switch
	MAN	Channel is on, set to manual mode
	ERR	V _{max} or I _{max} is / was exceeded
	INH	Inhibit signal was / is active
	QUA	Quality of output voltage not given at present
	L2H	Output voltage increasing
	H2L	Output voltage falling
	LAS	Look at Status (only after G-command)
	TRP	Current trip was active

If output voltage has been shut off permanently (by ERR or INH at ENABLE KILL or TRP) the command "Read status word" must be executed before the output voltage can be restored.

Error codes:

????	Syntax error
?WCN	Wrong channel number
?TOT	Timeout error (with following reinitialization)
?<SP>UMAX=nnnn	Set voltage exceeds voltage limit

Module status:

Status	Description		Bit	Valency
QUA	Quality of output voltage not given at present		7=1	128
ERR	V_{max} or I_{max} is / was exceeded		6=1	64
INH	INHIBIT signal	was / is active	5=1	32
		inactive		0
KILL_ENA	KILL-ENABLE is	on	4=1	16
		off		0
OFF	Front panel HV-ON switch in	OFF position	3=1	8
		ON position		0
POL	Polarity set to	positive	2=1	4
		negative		0
MAN	Control	manual	1=1	2
		via RS 232 interface		0
T1: U/I	Display dialled to	voltage measurement	0=1	1
		current measurement		0

Auto start:

Description		Bit	Valency
If the precondition for Auto start (module status: OFF + ERR + INH + MAN = 0) is satisfied, the output voltage is automatically ramped to the set voltage. Thus the G-command or POWER-ON and OFF \Rightarrow ON are not required.		3=1	8
If output voltage has been shut off permanently (by ERR or INH at ENABLE KILL or TRP), the previous voltage setting will be restored with software ramp after "Read status word".			
Values are written to the registers only at POWER-ON!	Save Current trip to EEPROM	2=1	4
	Save Set voltage to EEPROM	1=1	2
	Save Ramp speed to EEPROM	0=1	1

(EEPROM guarantees a minimum of 1 million saving cycles)

Hints for the use of EHQ 1 channel with new command list

The remote control of the unit can either be done with the new SCPI command list described in the following or with the old DCP command list described in the operators manual

“EHQ 102M / 103M / 104M / 105M” see page 6 to 10

Switching between the different command sets can be done with the following commands:

*INSTR? query the selected instruction set
 reply *EDCP* or *DCP*

*INSTR,SCPI
or
*INSTR,EDCP select SCPI instruction set

*INSTR,iseq
or
*INSTR,DCP select old iseg instruction set

The ChannelStatus register describes the actual status. Depending on the status of the module the bits will be set or reset.

The bit InputError will be set if the given parameter is not plausible or it exceeds the module parameters (e.g. if the command Vset=4000V is given to a module with NominalVoltage=3000V). The bit InputError is not set if the given values are temporarily not possible (e.g. Vset=2800 at a module with NominalVoltage=3000V, but HardwareLimitVoltage=2500V). A certain signature which kind of input error it is does not exist.

isVLIM	IsVoltageLimitExceeded	voltage limit set by V_{max} is exceeded
isCLIM	IsCurrentLimitExceeded	current limit set by I_{max} is exceeded
isTRP	IsTripExceeded	Trip is set when Voltage or Current limit or Iset has been exceeded (when KillEnable=1)
isEINH	IsExtInhibit	External Inhibit
isVBND	IsVoltageBoundsExceeded	Voltage out of bounds
isCBND	IsCurrentBoundsExceeded	Current out of bounds
isCV	IsControlledVoltage	Voltage control active (evaluation is guaranteed when no ramp is running)
isCC	IsControlledCurrent	Current control active (evaluation is guaranteed when no ramp is running)

Channel control: (read access)

:READ:CHANnel:CONTRrol?

UI2

Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
res	res	res	res	res	res	res	res	res	res	setEMCY	res	setON	res	res	res

The signals SetOn and SetEmergencyOff control are basic functions of the channel. The signal SetOn is switching ON the HV of the channel and is a precondition for giving voltage to the output. As far as a VoltageSet has been set and no event has occurred and is not registered yet (in minimum, bit 10 to 15 of the register Channel Event Status must be 0), a start of a HV ramp will be synchronized (a ramp is a software controlled, time proportionally increase / decrease of the output voltage).

setEMCY	SetEmergencyOff	Set "Emergency Off"
setON	SetOn	Set On
res	Reserved	

setEMCY=0 channel emergency cut-off works

setEMCY=1 cut-off Vo shut off to 0V without ramp

setOn=0 switch the channel to OFF

setOn=1 switch the channel to ON

(If Vset has been set to a value unequal to zero (0V) before the status bit 'isOn' is changed from (1) one to (0) zero a ramp down of the voltage to zero (0V) will be started.)

ModuleStatus (read access)

UI2																
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	
isKILena	isTMPgd	isSPLYgd	isMODgd	isEVNTact	isSFLPgd	isnoRAMP	isnoSERR	res	res	isHwVLIMgd	isSrv	res	res	res	isADJ	

The status bits as there are IsTemperatureGood, IsSupplyGood, IsModuleGood, IsEventActive, IsSafetyLoopGood, IsNoRamp and IsNoSumError indicate the single status for the complete module.

isKILena	IsKillEnable	Module state of kill enable
isTMPgd	IsTemperatureGood	Module temperature good
isSPLYgd	IsSupplyGood	Power supply good
isMODgd	IsModuleGood	Module in state good
isEVNTact	IsEventActive	Any event is active and mask is set
isSFLPgd	IsSafetyLoopGood	Safety loop closed
isnoRAMP	IsNoRamp	All channels stable, no ramp active .
isnoSERR	IsNoSumError	Module without failure
isHwVLIMgd	IsHardwareVoltageLimitGood	Hardware voltage limit in proper range, only for HV distributor modules with current mirror;
isSrv	IsService	Hardware failure detected (consult iseg Spezialelektronik GmbH)
isADJ	IsFineAdjustment	Mode of the fine adjustment
res	Reserved	

isKILena=0	Module in state kill disable	isSFLPgd=0	safety loop is broken - VO has been shut off
isKILena=1	Module in state kill enable	isSFLPgd=1	safety loop is closed
isTMPgd=0	if module temperature is higher than 55°C then all channels are switched off permanently	isnoRAMP=0	V _o is ramping in at least one channel
isTMPgd=1	module temperature is within working range	isnoRAMP=1	no channel is ramping
isSPLYgd=0	supply voltages are out of range (range 24V +/-10% and 5V +/-5%)	isnoSERR=0	voltage limit, current limit, trip, voltage bound or current bound has been exceeded in at least one of the channels or external INHIBIT error, reset by reset of the corresponding flag of the 'Channel Status'
isSPLYgd=1	supply voltages are within range	isnoSERR=1	evaluation of the 'Channel Status' over all channels to a sum error flag
isMODgd=0	module is not good, that means (isnoSERR AND (ETMPngd OR ESPLYngd OR ESFLPngd))==0	isHwVLIMgd=0	LIM&CLIM&CTRP&EINH&VBND&CBND=0 no errors
isMODgd=1	module is good, that means (isnoSERR AND NOT(ETMPngd OR ESPLYngd OR ESFLPngd))==1 (see module event status also)	isHwVLIMgd=1	hardware voltage limit not in proper range
isEVNTact=0	no Event is active	isADJ=0	hardware voltage limit in proper range
isEVNTact=1	any Event is active	isADJ=0	Fine adjustment is off.
			Fine adjustment is on (default)

Module EventStatus (read access)

doCLEAR=0	no action

Common-instructions

The common instruction set is independent from the selected language (iseg or SCPI) and can be used always.

*IDN?	query module identification reply <i>iseg Spezialelektronik GmbH,EHQ 103,480403,3.00</i>
*CLS	clear module (event-)status
*RST	Reset: restart of the device
*INSTR?	query the selected instruction set reply <i>EDCP</i> or <i>DCP</i>
*INSTR,SCPI or *INSTR,EDCP	select SCPI instruction set
*INSTR,iseg or *INSTR,DCP	select old iseq instruction set
