### Operator's Manual VHS-Interface

---

## **Attention!**

- It is not allowed to use the unit if the covers have been removed.
- We decline all responsibility for damages and injuries caused by an improper use of the module. It is highly recommended to read the manual before any kind of operation.

## **Note**

The information in this manual is subject to change without notice. We take no responsibility for any error in the document. We reserve the right to make changes in the product design without notification to the users.

## 1. General information

The 12 channel VHS modules are High Voltage power supplies in 6U VME format in double width. The units are controlled exclusively via the VME bus system. The output voltage features a high stability, low ripple and noise and low temperature coefficient. Each single channel has an independent voltage and current control. The data for set and measure values is given in a format of Floating Point Single Precision values. The modules are equipped with 24 bit ADC and 20 bit DAC circuits.

The channels share a Common-GND, which is connected to the internal Crate-Ground.

The HV output is available as a 51 pin REDEL HV connector or as SHV connectors.

## 2. Technical data

	VHS C005 <sup>*)1</sup> x	VHS C010 <sup>*)1</sup> x	VHS C020 <sup>*)1</sup> x	VHS C030 <sup>*)1</sup> x	VHS C040 <sup>*)1</sup> x	VHS C060 <sup>*)1</sup> x			
HV channels per module	12	12	12	12	12	12			
Output voltage $V_{O \text{ nom}}$ [kV]	0.5	1	2	3	4	6			
Output current $I_{O \text{ nom}}$ [mA]	15	8	4	3	2	1			
Resolution of voltage setting <sup>*)</sup> [mV]	2	4	5	10	10	15			
current setting <sup>*)</sup> [nA]	150	80	40	30	20	10			
voltage measurement <sup>*)</sup> [mV]	2	4	5	10	10	15			
current measurement <sup>*)</sup> [nA]	150	80	40	30	20	10			
<sup>*)</sup> with standard sample rate 500/s and digital filter 64									
Ripple and noise [mV <sub>P-P</sub> ]	< 10			< 30					
	- at max. load and $ V_O  > 1\% * V_{O \text{ nom}}$								
	- f > 10 Hz								
Stability(no load/load and $\Delta V_{IN}$ )	0,02%* $V_{O \text{ nom}}$								
Sample rates [samples/s]	5, 10, 25, 50, 60, 100, 500								
Digitalfilter averages	1, 16, 64, 256, 512, 1024								
The resolution of measurable values depends on the settings of the sampling rate and the digital filter!									
Accuracy of voltage measurement	$\pm (0,01\% * V_O + 0,02\% * V_{O \text{ nom}})$								
Accuracy of current measurement	$\pm (0,02\% * I_O + 0,02\% * I_{O \text{ nom}})$								
The measurement accuracy is guaranteed in the range $1\% * V_{O \text{ nom}} < V_O \leq V_{O \text{ nom}}$ and for 1 year									
Voltage ramp up / down [V/s]	$1 \cdot 10^{-6} * V_{O \text{ nom}}$ up to $0,2 * V_{O \text{ nom}}$								
Temperature coefficient	$< \pm 50 * 10^{-6}/K$								
Hardware limits $V_{max}$ / $I_{max}$	potentiometer per module ( $V_{max}$ / $I_{max}$ is the same for all channels)								

	VHS C005 <sup>y1</sup> x	VHS C010 <sup>y1</sup> x	VHS C020 <sup>y1</sup> x	VHS C030 <sup>y1</sup> x	VHS C040 <sup>y1</sup> x	VHS C060 <sup>y1</sup> x
Interface	VME-Interface					
Module status	green LED turns on if all channels have the status "ready"					
Protection loop ( $I_s$ ) potential free (2 pin Lemo-socket and REDEL SL)	$5 \text{ mA} < I_s < 20 \text{ mA}$ $\Rightarrow$ module on $I_s < 0,5 \text{ mA}$ $\Rightarrow$ module off					
Power requirements $V_{\text{INPUT}}$	$\pm 12 \text{ V} (< 5,8 \text{ A})$ and $+ 5 \text{ V} (< 0,4 \text{ A})$					
Packing	6U VME cassette (double width and 164 mm deep)					
Connector on the rear	96-pin connector according to DIN 41612					
HV connector	51 pin REDEL HV connector (R51) SHV connectors (SHV)					
Operating temperature	0 ... +40 °C					
Storage temperature	-20 ... +60 °C					

### 3. Handling

#### 3.1 Connection

The supply voltages and the VME interface are connected to the module via a 96-pin connector on the rear side of the module.

#### 3.2 Limits

The maximum output voltage for all channels (hardware voltage limit) is defined through the position of the corresponding potentiometer  $V_{\max}$ .

The maximum output current for all channels (hardware current limit) is defined through the position of the corresponding potentiometer  $I_{\max}$ .

The greatest possible set value for voltage and current is given by  $V_{\max} - 2\%$  and  $I_{\max} - 2\%$ , respectively.

It is possible to measure the hardware voltage and current limits at the sockets below the potentiometer. The socket voltages are proportional to the relative limits, where 2,5 V corresponds to  $102 \pm 2\% V_{O \text{ nom}}$  and  $102 \pm 2\% I_{O \text{ nom}}$ .

The output voltage and current are limited to the specified value. If a limit is reached or exceeded in any channel the green LED on the front panel turns off.

#### 3.3 Safety Loop

The socket for the safety loop (global interlock signal) is in the middle of the front panel. If the safety loop is active then an output voltage in any channel is only present if the safety loop is closed and an external current in a range of 5 to 20 mA of any polarity is driven through the loop. If the safety loop is opened during the operation the output voltages are shut off without ramp and the corresponding bits in the 'ModuleStatus' (see manual "Operator's Manual VHS-Interface" 2.2.1 Modul Registers (ModuleStatus and ModuleEventStatus) are cancelled. After closing the loop again the ModuleEventStatus has to be restored and the channels have to be switched ON.

The pins of the loop are potential free, the internal voltage drop is approx. 3 V. In the factory setup the safety loop is not active (the corresponding bits are always set). The loop can be activated by removing the jumper "ILK", which can be found on the topside of the board (see manual "Operator's Manual VHS-Interface", app. B).

---

### 3.4 Option: Single Channel INHIBIT

Optionally it is possible to install an INHIBIT for each channel via two Sub-D connectors. Channel 0 to 7 corresponds to Pin 1 to 8 at the 1<sup>st</sup> Sub-D connector, Pin 9 is connected to GND. Channel 8 to 11 corresponds to Pin 1 to 4 at the 2<sup>nd</sup> Sub-D connector, Pin 9 is connected to GND. Internally the inputs can be connected either with a pull down (option IND) or a pull up resistor (option INU).

If the INHIBIT contact pin (n) is connected to the GND or a TTL-LOW potential the behavior of HV-PS in this channel depends on the following setting (2.2.1 Modul Register, bit SetKillEnable):

KILL-enable = 1: Voltage is switched off permanently without ramp. ChannelEventStatus flag 'EEINH' is set.  
The green LED at the front panel turns off.

KILL-enable = 0: ChannelStatus flag 'isEINH' and ChannelEventStatus flag EEINH are set. The action of the HV channel can be defined via the Monitoring group (2.2.3.2.3 Monitoring group, MonitorIsExternalInhibit). The green LED at the front panel turns off.

When the INHIBIT is no longer active (TTL-HIGH potential or not connected), the INHIBIT flag must be reset before the voltage can be switched ON again (2.2.2 Channel registers ChannelEventStatus).

## 4. Connector layout

### 51 pin REDEL HV connector

C-RTN is connected with the Modul-GND and the shield

## **5. Order Information**
