

EHS Series

Versatile High Precision High Voltage Module with multiple Floating Options

- 4 / 8 / 16 / 24 / 32 / 48 channel, 100 V – 20 kV versions
- very low ripple and noise
- hardware voltage and current limits
- voltage and current control per channel
- programmable parameters (delayed trip etc.)

Document history

Version	Date	Major changes
2.0	06.04.2017	Relayouted documentation & fixes
2.1	03.08.2017	Fixed Itemcodes EHS CFG FLEX
2.2	17.09.2018 01.10.2018	Added Pin assignments R51.44, R51.46, I50.52 Notes revised

This document is under copyright of iseg Spezialelektronik GmbH, Germany. It is forbidden to copy, extract parts, duplicate for any kind of publication without a written permission of iseg Spezialelektronik GmbH. This information has been prepared for assisting operation and maintenance personnel to enable efficient use.

The information in this manual is subject to change without notice. We take no responsibility for any mistake in the document. We reserve the right to make changes in the product design without reservation and without notification to the users. We decline all responsibility for damages and injuries caused by an improper use of the device.

Important security information

It is strongly recommended to read the operator's manual before operation. To avoid injury of users it is not allowed to open the unit. There are no parts which can be maintained by users inside of the unit. Opening the unit will void the warranty.

We decline all responsibility for damages and injuries caused by an improper use of the module. It is strongly recommended to read the operators manual before operation.

WARNING!
The non-observance of the advices marked as "Warning!" could lead to possible injury or death.

ATTENTION!
Advices marked as "Attention!" describe actions to avoid possible damages to property.

INFORMATION
Advices marked as "Information" give important information.

1 General description

ATTENTION!

The devices must only be used in combination with iseg approved crates.

ATTENTION!

1.1 EHS Standard series

EHS Standard modules are multichannel high voltage power supplies in MMS system (Eurocard format). The output voltage features a high stability, low ripple and noise and low temperature coefficient. With up to 48 channels each single channel has an independent voltage and current control. By offering different configurations and options this module perfectly covers various types of applications such as detector supply, experimental setup or lab use. The EHS Standard module is available in three floating versions, Common Floating Ground (CFG), Floating Ground (FG) and Common Ground (CG).

1.2 EHS High Precision series

The EHS High Precision modules are multichannel high voltage power supplies in MMS system (Eurocard format) with exceptionally high stability, very low temperature coefficients and very low ripple and noise characteristics. With up to 16 channels each single channel has an independent voltage and current control. Compared to a standard module the High Precision EHS is equipped with a second current measurement range to precisely meter low currents. Switching between measurement ranges is done automatically. By offering different configurations and options this module perfectly covers various types of applications such as detector supply, experimental setup or lab use. The EHS High Precision module is available in two floating versions, Common Floating Ground (CFG) and Floating Ground (FG).

2 Technical data

2.1 EHS Standard series

SPECIFICATIONS	EHS CG	EHS CFG	EHS FG		
Polarity	Factory fixed, positive or negative				
Floating principle	Common Ground	Common Floating Ground	Single Floating Ground		
Potential difference	none	56 V channel/GND	20 V channel/channel/GND, opt. up to 2 kV		
Ripple and noise (f > 10 Hz)	< 20 mV _{p-p} I < 3-5 mV _{p-p} opt. VLN	< 10 mV _{p-p}			
Ripple and noise (f > 1 kHz)	< 2 - 3 mV				
Stability					
Stability [ΔV_{out} vs. ΔV_{in}]	$< 1 \cdot 10^{-4} \cdot V_{nom}$				
Stability - [ΔV_{out} vs. ΔR_{load}]	$< 5 \cdot 10^{-4} \cdot V_{nom}$	$< 2 \cdot 10^{-4} \cdot V_{nom}$			
Long term stability (1h warmup) 24h	$< 5 \cdot 10^{-5} \cdot V_{nom}$				
Temperature coefficient	< 50 ppm / K				
Resolution - The resolution of measurable values depends on the settings of the sampling rate and the digital filter!					
Resolution voltage setting	$2 \cdot 10^{-6} \cdot V_{nom}$		$4 \cdot 10^{-5} \cdot V_{nom}$		
Resolution current setting	$2 \cdot 10^{-6} \cdot I_{nom}$		$4 \cdot 10^{-5} \cdot V_{nom}$		
Resolution voltage measurement	$2 \cdot 10^{-6} \cdot V_{nom}$				
Resolution current measurement	$2 \cdot 10^{-6} \cdot I_{nom}$				
Measurement accuracy - The measurement accuracy is guaranteed in the range $1\% \cdot V_{nom} < V_{out} < V_{nom}$ and for 1 year					
Accuracy voltage measurement	$\pm (0.01 \% \cdot V_{out} + 0.02 \% \cdot V_{nom})$				
Accuracy current measurement	$\pm (0.02 \% \cdot I_{out} + 0.02 \% \cdot I_{nom})$				
Sample rates ADC (SPS)	5, 10, 25, 50, 60, 100, 500				
Digital filter averages	1, 16, 64, 256, 512, 1024				
Voltage ramp up / down	up to $0.2 \cdot V_{nom} / s$	up to $0.2 \cdot V_{nom} / s$ opt. up to $0.75 \cdot V_{nom} / s$			
Hardware limits	Potentiometer per module [V_{max} and I_{max}]				
Limit monitor voltage	2.5 V				
Digital interface	CAN				
Protection	Safety loop, overload and short circuit protected (there is only one short circuit or arc per second allowed!), opt. INHIBIT per channel (ID / IU, NID / NIU)				
HV connector	R51 SHV				
System connector	96 PIN (MMS HV compatible)				
Safety loop connector	Lemo 2pole				
Limit monitor connector	Lemo 1pole	Lemo 2pole	Lemo 1pole		
Case	19" plug-in cassette				
Dimensions – L/W/H	220mm / 8HP / 6U				
Operating temperature	0 – 40 °C				
Storage temperature	-20 -60 °C				
Humidity	20 - 80 %, not condensing

3 Handling

3.1 Connection

The supply voltages and the CAN interface are connected to the module via a 96-pin connector on the rear side of the module. The physical address of the module, determined by the slot position in the crate, is also accessible via this connector. Modules and crate controllers with different settings of bit rate do not work on the same CAN-Line.

INFORMATION
 Note: For proper operation the module must be configured with the correct CAN bitrate, which meets the configuration of the crate controller, the module will be used with. The delivery condition is shown on the modules typeplate (side plate of the module).
INFORMATION Typically newer iseg crate controllers (CC24, CC23, CC238) are delivered with 250kBits/s standard. Wiener M-POD Controller and older iseg hardware is set on 125 kBit/s standard bitrate.

3.2 Module status

The module status is displayed by two LEDs on the front panel

green LED „OK“ on	all channels have the status “OK”
green LED „OK“ off	an error occurred: safety loop is possibly not closed or the power supplies are out of tolerance or the threshold of V_{max} , I_{max} , I_{set} or I_{trip} (see function descriptions for details) has been exceeded LED will be switched off until the error has been fixed and the corresponding status bit has been erased via software interface.
yellow LED on	one or more channels voltage on output is more than 56V
Green LED blinking slow	prepares firmware update
Green LED blinking fast	Firmware update is stored into flash, do not switch off power supply, crate etc.

Table 4: Module status information

3.3 Hardware Limit

The maximum output voltage for all channels (hardware voltage limit) is defined by the position of the corresponding potentiometer V_{max} . The maximum output current for all channels (hardware current limit) is defined by the position of the corresponding potentiometer I_{max} . The highest possible set value for voltage and current is given by $V_{max} - 2\%$ and $I_{max} - 2\%$, respectively. It is possible to measure the hardware voltage and current limits at the sockets below the potentiometer. The socket voltages are proportional to the relative limits, where 2.5 V corresponds to $102 \pm 2\% V_{nom}$ and $102 \pm 2\% I_{nom}$. The output voltage and current are limited to the specified value. If a limit is reached or exceeded in any channel the green LED on the front panel turns off.

3.4 Safety Loop

A safety loop can be implemented by the safety loop socket (SL) on the front panel and between the SLcontacts (Pin 22 and PIN 30) at the REDEL-connector, if equipped. If the safety loop is active a high voltage generation in any channel is only possible if the safety loop is closed and an external current in a range of 5 to 20 mA of any polarity is driven through the loop. (For modules with a REDEL-connector the front panel SL input must be shortened.) If the safety loop is opened during the operation the output voltages will be shut off without ramp and the corresponding bits in the ModuleStatus and ModuleEventStatus are cancelled (see "CAN_EDCP_Programmers-Guide.pdf"). After closing the loop again the ModuleEventStatus has to be reset and the channels have to be switched ON. The loop connectors are potential free, the internal voltage drop is approx. 3 V. By factory setup the safety loop is not active (the corresponding bits are always set). The loop can be activated by removing the jumper "SL-disable" on the rear side of the module.

3.5 Delayed Trip

3.5.1 Operating principle

The function "*Delayed Trip*" provides a user-configurable, time-delayed response to an increased output current (I_{out}) higher than the set current (I_{set}). The response to this kind of event can be, for example, to ramp down the channel with the programmed ramp. A detailed description for the configuration can be found in the manual **CAN_EDCP_Programmers-Guide.pdf** (see **appendix**).

By a programmable timeout with one millisecond resolution, the trip can be delayed up to four seconds. During this time, the output current is limited to the value of I_{set} (constant current mode).

The hardware regulation signals, constant voltage (CV) or constant current (CC), are sampled every millisecond by the microprocessor. Once the constant current mode is active, the programmed timeout counter is decremented. If the HV channel returns to constant voltage mode before timeout (i.e. $I_{out} < I_{set}$), the counter will be reset. So this process can be restarted if the current rises again.

3.5.2 Limitations

For some older types of HV modules with single-channel floating GND the current set value cannot be set exactly to zero (e.g., due to an uncompensatable offset). For these modules, the limitation of the output current to very low values (< 0.5 % I_{nom}) is not guaranteed.

For all recent EHS models the value of the set current can be continuously adjusted with the type-specific resolution down to zero.

To guarantee a sufficient resolution for the current set values, a nominal current adequate to the application should be selected. iseg offers HV modules with nominal currents reduced to 100 µA or 10 µA in all voltage classes. These are designated e.g. for semiconductor detectors, which only require a few microampere operating current.

3.5.3 Modules with two current measurement ranges

High Precision HV modules with two current ranges are a particular case. In these HV modules the high current output is combined with a picoampere resolution in the low current measurement range. The range switching is done by the microprocessor depending on I_{meas} :

High measuring range: $I_{nom-low} < I_{meas} < I_{nom}$

Low measuring range: $0 < I_{\text{meas}} < I_{\text{nom-low}}$

The typical value for $I_{\text{nom-low}}$ is 20 µA.

As long as a set current in the high measuring range is used, everything is working as described above. If a set current in low measuring range is specified, the current limitation is set to 120 % of the low measuring range.

Example: $I_{\text{nom-low}} = 20 \mu\text{A} \rightarrow$ current limitation is set to 24 µA if $I_{\text{set}} = 10 \mu\text{A}$

Now the channel operates in the low measuring range only. A software comparison of set current I_{set} and measured current I_{meas} is performed in addition to the described hardware CC and CV signals sampling.

With this principle, two requirements are met:

- the output current will not exceed 24 microamps even during fast changes and
- the delayed trip function is extended into the region of very small currents (picoampere) for these HV modules.

For the software comparison, a delay between 80 milliseconds and 1 second must be expected. This depends on the modules ADC (Analog-to-digital-converter) configuration.

This time can be adjusted by changing the ADC sample rate to meet the requirements of the application. Higher ADC sample rates lead to shorter delays but also reduce the resolution.

If the *Delayed Trip* function is activated the voltage ramp should be limited to 1 % of V_{nom} before. Higher values could trigger a trip by internal charge balancing during a ramp, even though the output current does not exceed the set value I_{set} .

If the connected load contains capacities or if I_{set} is very small, it might be necessary to further reduce the ramp speed.

Alternatively, the *Delayed Trip* can be activated only after the completion of the ramp.

INFORMATION

An activated KillEnable feature disables the Delayed Trip function.

INFORMATION

An active *KillEnable* function disables the *Delayed Trip* function. If *KillEnable* is active and a trip occurs, the channel is shut down without ramp at the fastest hardware response time (smaller than 1 ms). However, the actual discharge time strongly depends on the connected load.

4 Options

4.1 VCT (for EHS CFG) – voltage correction by temperature

This option allows a temperature dependent correction of the output voltage. The temperatures are measured with a distinct sensor for each channel. An user-adjustable VCT-coefficient allows to specify a linear relationship between the measured temperature and the output voltage. As an option one sensor per module can be ordered.

4.1.1 Technical data

Sensor type	EPCOS B57867S0502F140
Temperature range	-40 ... 80°C
Accuracy of temperature measurement	±0.5 K (0 ... 60°C)
Resolution of temperature measurement	1 mK (0 ... 60°C)
Temperature update rate	15 updates/min

Table 5: Technical data VCT sensor

4.1.2 Operation

The connector of the temperature sensor must be plugged in the slot of the corresponding channel on the VCT-connector at the

front panel of the HV-module. The direction of the male connector does not matter.

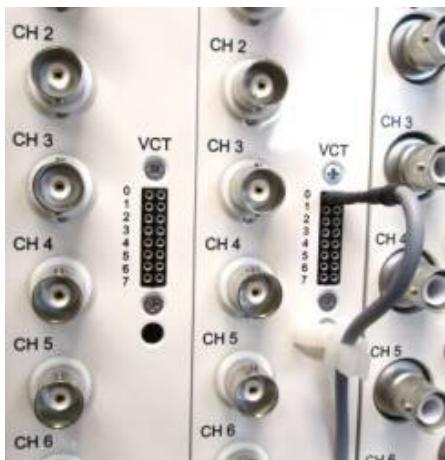

Figure 1: VCT modul

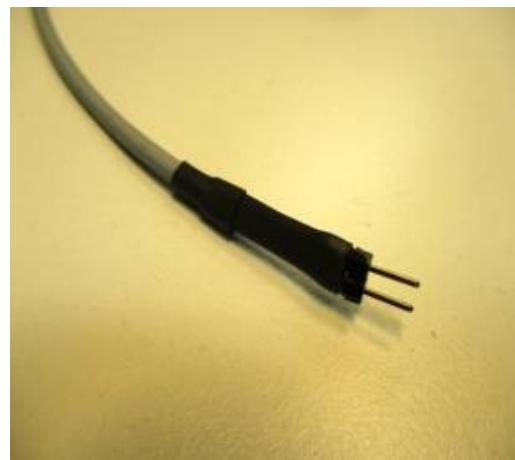

Figure 2: VCT

A programmable VCT-coefficient for each channel defines the rate and the direction of the voltage correction. The temperatures, measured at the sensors can be read out from the module.

At the time a HV-channel is switched on or the output voltage is set by the user, the module registers the temperature of the corresponding sensor and the set voltage as reference values.

If the temperature at the sensor changes, the output voltage is automatically adjusted according to the formula:

$$V = V_{ref} + a * (T - T_{ref}) \quad (\text{a...VCT-coefficient})$$

Example: A channel is set to 60V. At the time it is switched on a temperature of 25°C is measured. The VCT-coefficient is set to +1V/K. If the temperature now increases to 26°C the output voltage will increase to 61V. (For channels with a negative output voltage the voltage changes from -60V to -61V).

A VCT-coefficient of -1V/K would decrease the voltage to 59V.

Notes:

- During operation the values for V_{set} are adjusted. If a channel is switched off the adjusted set value will be kept, not the original value set by the user.
- If the VCT-coefficient is modified during operation, V_{ref} and T_{ref} are reset to the present values to prevent a sudden voltage change.
- If the temperature sensor is disconnected during operation, V_{ref} and T_{ref} are reset to the present values to prevent a sudden voltage change.
- The temperature dependent voltage correction can be deactivated by setting the VCT-coefficient to 0 or by disconnecting the temperature sensor. If this is done during operation, the channel will keep the actual voltage set.
- If the temperature sensor is disconnected a temperature of -273.15°C is shown for that channel.
- The VCT data points are described in the reference manual "**CAN EDCP Programmers-Guide**" (see appendix) and in the manual "**iseg Hardware Abstraction Layer**" (see appendix).

4.2 Single Channel Inhibit (IU, ID, NIU, NID)

INFORMATION
 INHIBIT is an external signal, that switches off the high voltage for the device or a specific channel
INFORMATION

Optionally it is possible to equip modules with an *INHIBIT* for each channel via a Sub-D connector. Channel 0 to 7 corresponds to Pin 1 to 8 at the Sub-D connector, Pin 9 is connected to GND.

KILL-enable = 1: Voltage is switched off permanently without ramp. ChannelEventStatus flag 'EEINH' is set. The green LED at the front panel turns off.

KILL-enable = 0: ChannelStatus flag 'isEINH' and ChannelEventStatus flag EEINH are set. The action of the HV channel can be defined via the Monitoring group. The green LED at the front panel turns off.

The *INHIBIT* active time (LOW potential) must be at least 100 ms! When the INHIBIT is no longer active (TTL-HIGH potential or not connected), the INHIBIT flag must be reset before the voltage can be switched ON again.

4.2.1 Logic / Signal Level Standard

The INHIBIT - signal has negative logic, which means it is LOW-active. When applying a TTL-low-level on INHIBIT input the signal will be rated as ACTIVE, the high voltage generation will be switched off. (*see chapter connectors and pin assignment*)

Default state = state at non wired signal input: By applying of Pull-Up or Pull-Down resistors (approx. 10 kΩ) the Default-State will be defined.

Case 1 - IU

INHIBIT: Default inactive (=> high voltage is generated):

=> signal input has HIGH - level => pull-up resistor after V_{cc}

Switch off the HV by applying 0V on signal input

Case 2 - ID

INHIBIT: Default active (=> high voltage is not been generated):

=> signal input has LOW - level => pull-down resistor after 0V

Switch on the HV by applying V_{cc} on signal input

4.2.2 Logic / Signal Level Negated

The INHIBIT signal has positive logic, that means it is HIGH-active. By applying of TTL-High-Level on INHIBIT input the signal will be rated as ACTIVE, the high voltage generation will be switched off.

Default-State = state at non wired signal input:

Case 3 - NID

INHIBIT: Default inactive (=>high voltage is generated):

=> Signal input as LOW - level => Pull-Down resistor after 0V

Switch off the HV by applying of V_{cc} (5V) on signal input

Case 4 - NIU

INHIBIT: Default active (=>high voltage is not been generated):

=> Signal input has HIGH - level => Pull-Up resistor after V_{cc} (5V)

Switch on the HV by applying of 0V on signal input

4.3 SLA – Active safety loop

Actively opens the Safety loop in case of a trip or a delayed trip. This option allows to shut down other modules and devices by interrupting the SL when a trip is detected.

4.4 SLP – Internally powered safety loop

Internal current source for the Safety Loop (no galvanic isolation of the SL and the crate GND).

4.5 1CR – One current measurement range only (HP)

Only one current measurement range for High Precision Modules

4.6 F02 – High floating voltage

200 V isolation for Modules with FG

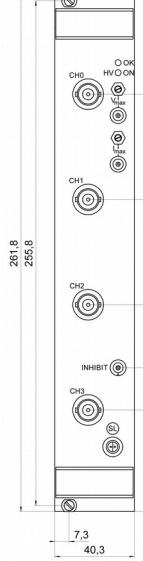

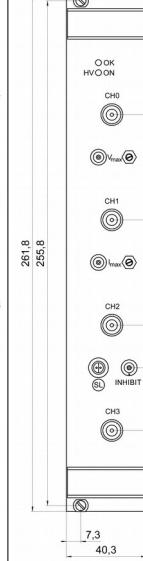

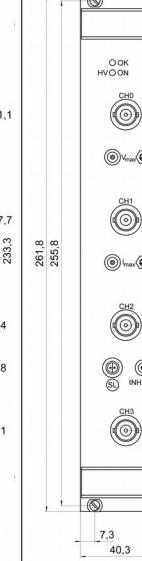

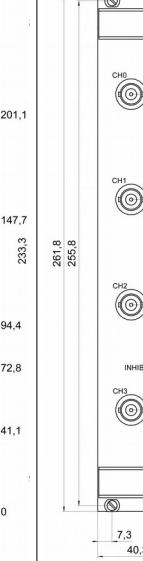

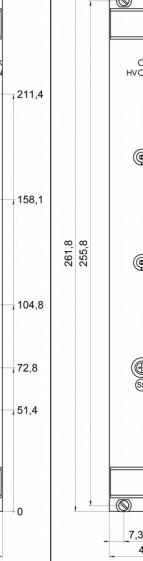

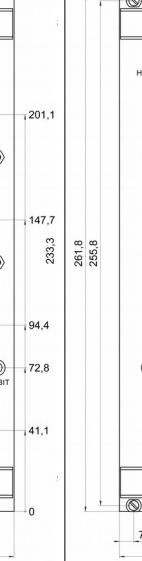

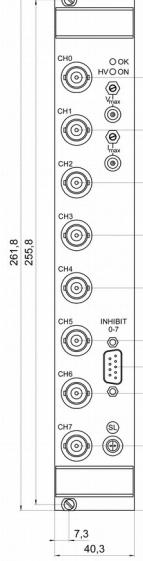

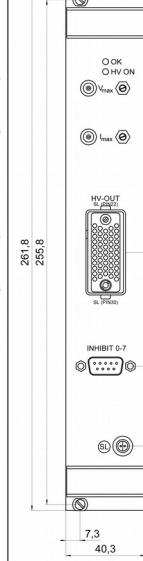

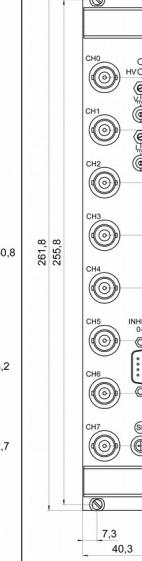

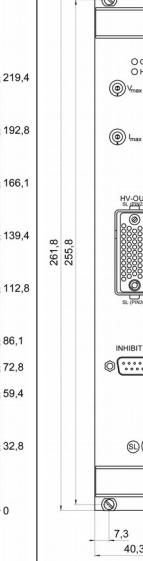

4.7 F20 – Very high floating voltage

2.000 V isolation for Modules with FG

4.8 T10 – Lower temperature coefficient

Improved temperature coefficient of 10ppm/K

10 Warranty & service

This device is made with high care and quality assurance methods. The factory warranty is up to 36 months, starting from date of issue (invoice). Within this period a 5 years warranty extension can be ordered at additional charge. Please contact iseg sales department.

ATTENTION

Repair and maintenance may only be performed by trained and authorized personnel.

For repair please follow the RMA instructions on our website: www.iseg-hv.com/en/support/rma
